

ESTUARY TRENDS IN WEATHER & WATER QUALITY

Resilient estuaries and coastal watersheds:
Where human and natural communities thrive.

Norrie Point Reserve Headquarters

Hudson River National Estuarine Research Reserve (NERR)

The Hudson River Estuary stretches 153 miles and is profoundly influenced by the ocean's tides. The Hudson River valley has been a cradle of human development for thousands of years. The tidal river connects the communities of the valley economically, culturally, and ecologically. The Hudson River Research Reserve spans the middle 100 miles of the Hudson River Estuary and is comprised of four sites: Stockport Flats, Tivoli Bays, Iona Island, and Piermont Marsh. A diversity of habits exist here, covering freshwater and brackish tidal wetlands and uplands. For more information go to:

<https://www.hrner.org/>

2018 HIGHLIGHTS

.....
It was drier - precipitation was below average compared to the long-term historical average.

.....
Dissolved oxygen was consistent with long-term historical trends at Norrie Point with a slight increase in the Indian Kill.

.....
Orthophosphate was consistent with long-term historical trends in the Indian Kill with a slight increase at Norrie Point.

.....
Nitrate increased slightly at both Indian Kill and Norrie Point.

Water quality issues influence human and environmental health.
The more we monitor our water, the better we will be able to recognize and prevent problems.

HOW IS NORRIE POINT CHANGING?

Precipitation is decreasing.

Air Temperature is not changing.

Water Temperature is not changing at Norrie Point, but increasing at Tivoli.

Chloride is increasing at all stations.

Algae (Chlorophyll-a) is decreasing at Norrie Point, but remaining the same at Indian Kill.

Trends in Weather & Water Quality*

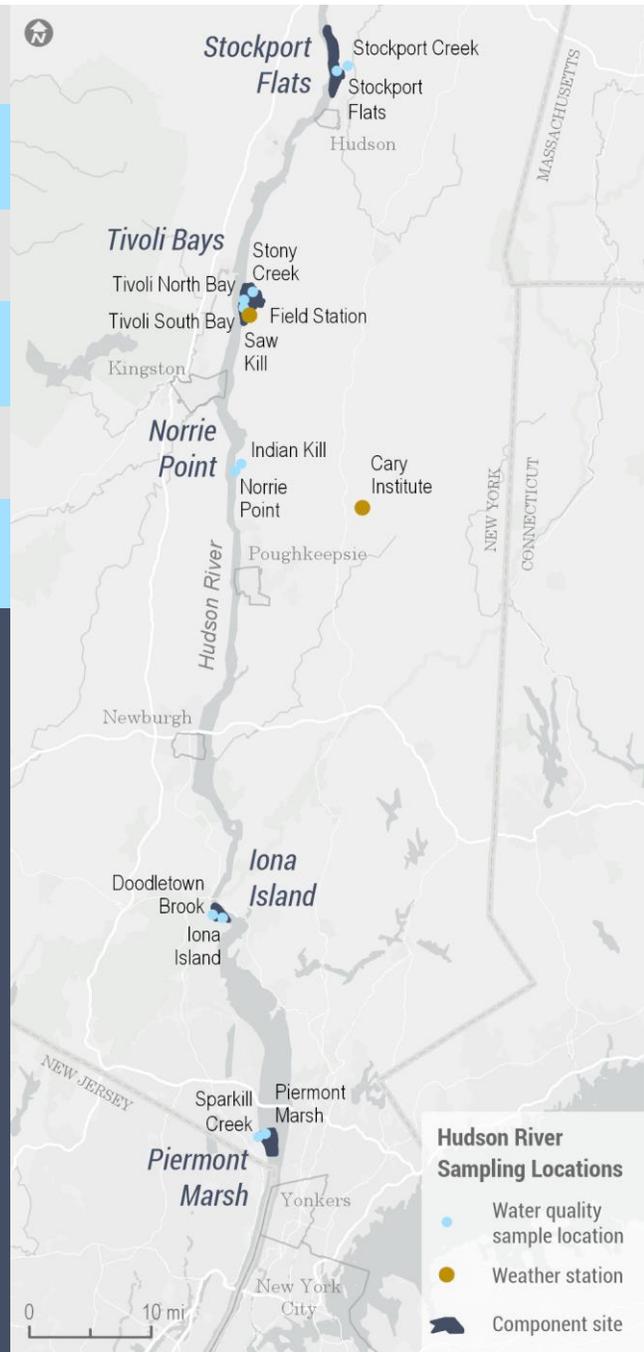

Norrie Point Reserve (Tivoli included for comparison)

Location ID	Location Name	Air Temp	Rainfall
FS	Field Station	•	↓

Location ID	Location Name	Water Temp	Salinity	Dissolved Oxygen	Chloride	Sulfate
IK	Indian Kill	•	•	↑	↑	•
NP	Norrie Point	•	↑	•	↑	•
SC	Stony Creek	↑	↑	•	↑	↓
TN	Tivoli North	↑	↑	↓	↑	↓

All other data collected from 1991-2018

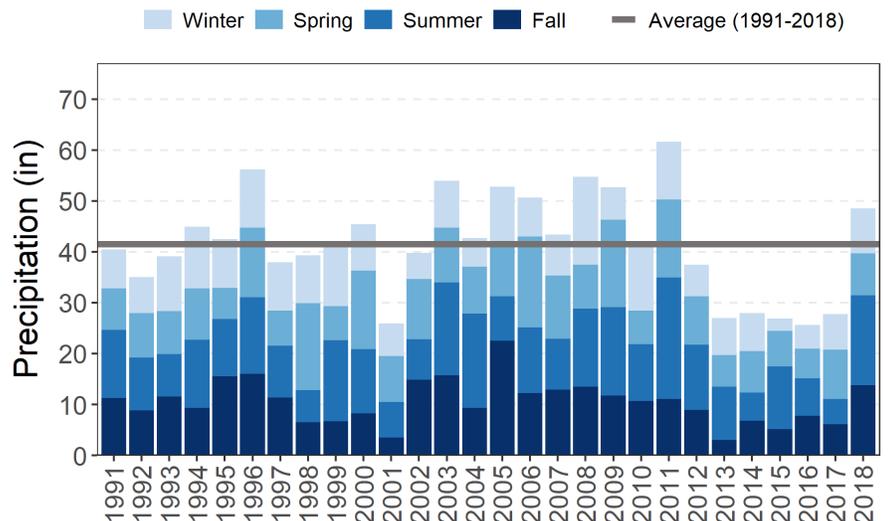

Weather Can Have A Major Impact On Water Quality

Weather data helps scientists and managers understand water circulation patterns, plant growth, shellfish and fish distribution, storm frequency and intensity, and much more...

Precipitation was ~12 to 20 inches less than the long-term historical average during 2013 to 2017, but slightly higher in 2018.

Field Station (FS)

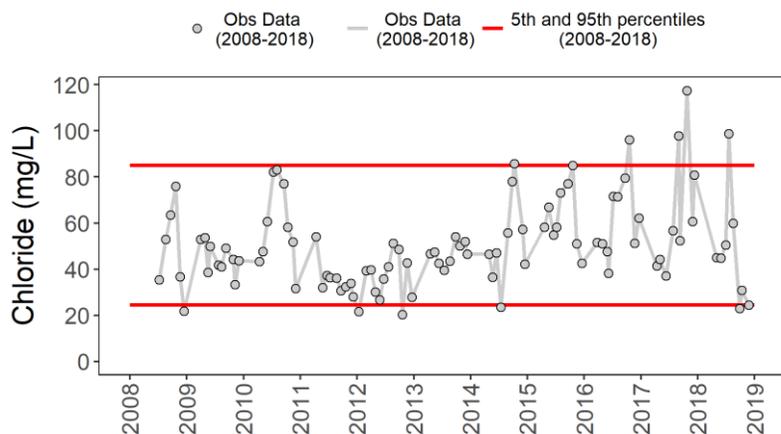

Do HRNERR data show climate change impacts?

The impacts of climate change, particularly sea level rise, are projected to be more extreme in the Mid-Atlantic region of the United States than in other areas of the world. HRNERR data do not show an increasing trend in air temperature, but do show an increase in water temperature. In 2017, HRNERR installed a tide station at Turkey Point (near the Tivoli Bays). Data from this station will be used to monitor changes in water level over time. Long-term data sets are extremely useful tools for monitoring future impacts of climate change to local ecosystems.

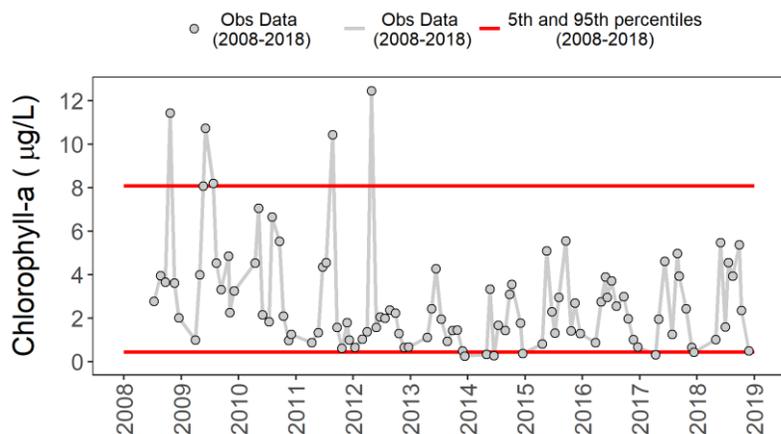

Norrie Point Reserve Headquarters

Indian Kill (IK)

Chloride has been accumulating in Hudson River tributaries. Potential causes include road salt, septic wastes, and water softeners. Life in the tributaries could be adversely affected.

Norrie Point (NP)

Chlorophyll-a measures algal growth. Harmful algal blooms (HABs) occur when excessive algae release toxins. In recent years, chlorophyll-a levels and algal growth have remained low.

Estuarine organisms, including, mammals, birds, fish, and crustaceans, have different tolerances and responses to the impacts of climate change. Shifts in temperature and water level could alter estuarine habitats. The types and locations of aquatic plants could change. These changes could impact how organisms use habitats for protection, food sources, and breeding grounds.

Water Quality is a MAJOR Driver of Ecosystem Change

What happens on the land affects the quality of the water and the health of the plants and animals that live in the estuary.

Why Estuaries Matter

Economic Impacts

Coastal shoreline counties provided 53 million jobs and contributed \$7.4 trillion (nearly 44%) of the nation's gross domestic product in 2012.

Community Benefits

Estuaries protect coastal communities by reducing flooding and storm surge impacts, enhancing water quality, and providing commercial and recreational benefits.

Healthy Ecosystems

Up to two-thirds of the nation's commercial fish and shellfish spend some part of their life cycle in an estuary or depend on this resource for food.

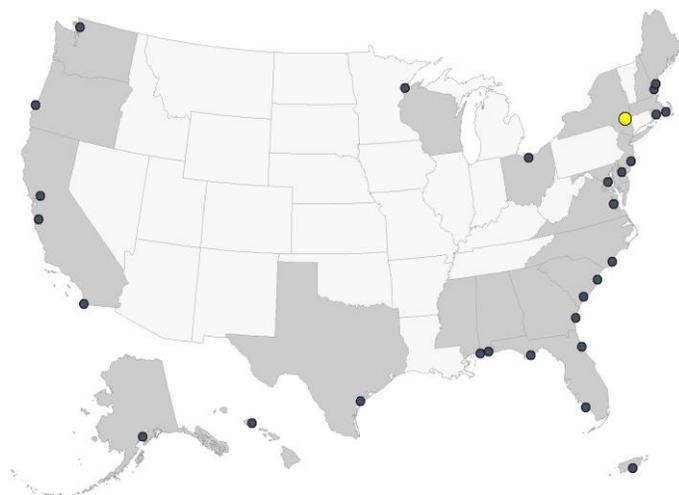

Habitat Diversity

Habitat types include shallow open waters, freshwater/salt marshes, swamps, sandy beaches, mud/sand flats, rocky shores, oyster reefs, mangrove forests, river deltas, tidal pools and seagrasses.

Tracking The Health of Our Estuaries 24/7

The **NERRS** is a partnership program between NOAA and the coastal states to manage designated reserves. More than 1.3 million acres of estuarine land and water are protected. Each reserve is managed on a daily basis by a lead state agency or university with input from local partners. The health of every reserve is continuously monitored by the **System Wide Monitoring Program (SWMP)**. SWMP is a **robust, long-term, and versatile** monitoring program that uses the NERRS network to intensively study estuarine reference sites for evaluating ecosystem function and change. Reserve-generated data and information are available to local citizens and decision makers. For more information, go to: <https://coast.noaa.gov/nerrs/>

NERRS is a network of 29 coastal reserves established for long-term research, education and stewardship.
